XUSB-2 Computer Changeover System

Live performance can be a bit nerve-wracking. Once the curtain rises it's a highly structured experience that must not, cannot, stop until it's finished. Quite apart from the interruption to the dramatic flow, actors' concentration and audience's engagement are hard to regain if a technical failure results in a stoppage.

With this in mind at Autograph a lot of time and energy is devoted to planning for the unexpected. Should the unthinkable happen our systems are equipped with a backup so that nothing brings the curtain down prematurely. The Autograph Signature Series XUSB-2 is designed for the quick and efficient changeover of two computer systems operating in critical environments. Conveniently packaged in a 1U rack mount design the XUSB-2 is compatible with both Apple Macintosh and Microsoft Windows computers, with no additional drivers or software required.

At the press of a button the XUSB-2 changes between main and backup systems so the show can carry on without interruption, switching keyboard, video and mouse as well as MIDI and contact control.

Independent logic processors within the XUSB-2 provide additional means of control via contact closures (Buttons) or MIDI. Control signals can be sent to main and backup computers simultaneously to keep them in sync. Combined with a Signature Series Audio Changeover the XUSB-2 provides a complete seamless changeover system for mission critical playback applications.

- Dual Head VGA /USB KVM Switch
- Dual Integrated USB Midi Interfaces
- Dual redundant Logic units
- Dual Redundant Power Supply
- Four output MIDI Thru device
- Remote switching
- Pseudo Tracking (MIDI or Contact Closures can be sent to both computers simultaneously)
- LCD Display shows all messages generated and system status.
